## More on Nullable<T>

`.HasValue` // false if null, true if valid value

`.Value` // gets underlying value

`.GetValueOrDefault()` // underlying value or default

`.GetValueOrDefault(default)` // value or specified default

# Comparing Nullable<T> Instances

```
int? i = 42;
```

```
int? j = 42;
```

```
bool areEqual = i == j; // true
```

# Nullable<T> Implicit and Explicit Conversions

// Implicit conversion from T --> Nullable<T>

```
int i = 42;
```

```
int? j = i; // no explicit cast required
```

# Nullable<T> Implicit and Explicit Conversions

// **Explicit conversion** required from Nullable<T> to T

```
int? i = 42;
```

```
int j = i; // error, invalid cast
```

```
int j = (int)i; // explicit cast
```

# Thread-safe Null Delegate Invocation

```
PropertyChangedEventHandler eventHandler = PropertyChanged;  
if (eventHandler != null)  
{  
    eventHandler(this, new PropertyChangedEventArgs(...));  
}  
  
PropertyChanged?.Invoke(this, new PropertyChangedEventArgs(...));
